

## Protect Your Institution!

### What is Penetration Testing?

Penetration Testing is an exercise in which an authorized source performs a simulated cyberattack against a system to discover any known or unknown vulnerabilities in said system. This can be done using both technical or non-technical methods in order to test compliance, Incident Response, or just technical awareness. This can be done as a one-off or on-going engagement.

### What does **infotex** offer?

- 
- ◆ **External and Blind Scanning** - Starting with a perimeter scan, **infotex** will look for any vulnerabilities during predetermined times and then exploit any non-disruptive findings that can be used to attain higher system access.
  - ◆ **Internal Network Scanning** - Utilizing a “mole” device on your network, our analysts will scan for any internal vulnerabilities and exploit any of those low-criticality findings.
  - ◆ **Analysis and Confirmation** - Our analysts will analyze collected data, confirm / test results, and then begin to create the deliverables.
  - ◆ **Social Engineering Leverage** - If we are also doing social engineering exercises with you, we will use any information discovered to inform the penetration testing.
  - ◆ **Reporting and Debriefing** - **infotex** will hold a final debriefing with you, take any response you may have, and then deliver a final report.
